

Add a Third-party Widget

You can add a widget to a plugin on specific layouts either through a widget slot or directly to a layout. A widget slot is a container or "area" (for a specific layout) that has been enabled (by a Cityworks developer) where a widget can be added. These widgets allow you to integrate with third parties.

1. Select a plugin to customize, such as Respond.

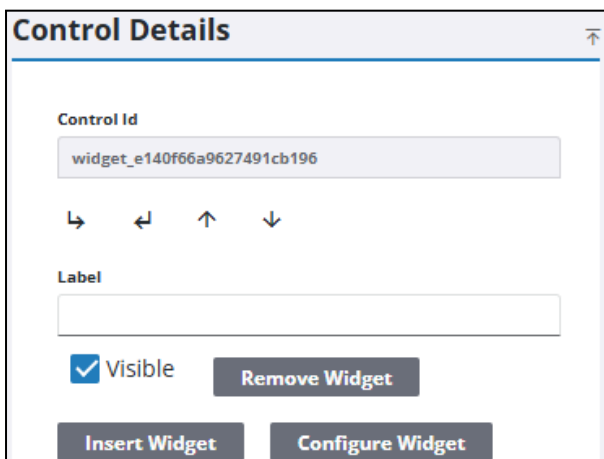

To add a widget to an enabled widget slot, complete the following:

2. Select the page from the **Layout** drop-down list in the **Profile** panel.
3. Select the widget slot you want to add a widget to.
4. Click **Add Widget**.

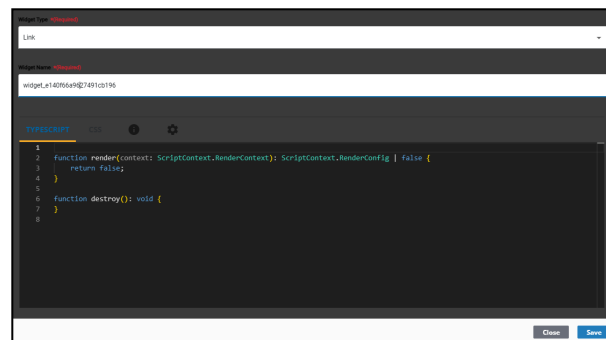

To add a widget to a specific layout:

- Select the page from the **Layout** drop-down list in the **Profile** panel.
- Select a control in the **Controls** panel.
- Click **Insert Widget**.
- Select the widget and click **Configure Widget**.

The **Widget Configurator** panel opens.

5. Select the **Widget Type: HTML or Link**.
6. Enter the **Widget Name**. This is what the users will see in the plugin.
7. Click the information icon for instructions and an example of adding a link widget.
8. Click the settings icon to change the theme for the editor.

9. Enter the code in the **Typescript** field. You can copy and paste the example code from the information icon, but don't forget to change the code (i.e., URL or Type (icon) to what you need).
10. Use the **CSS** field to style your **Typescript** code.

NOTE: Intellisense is available in the Typescript and CSS fields and allows you to easily create and complete your code.

11. Click **Save**.
12. Click **Save Profile** on the **Profile** panel to save changes to the profile.
