**Trimble Unity™**

Create a Theme

You can create custom themes to be used in apps.

1. Open the theme editor.
2. Click **Create** on the **Theme** panel.

The **Add Custom Theme** panel opens.

3. Enter a **Name** for the theme.
4. Click **Add**.

The **Theme** panel populates with different field types that can be modified, such as text input, number, check box, etc. You can base the theme on a pre-defined **Light** or **Dark** theme and then modify it by changing the overall primary, accent, and warning colors or by the specific field type.

5. Select your **Base Theme** of **Light** or **Dark**.

A **Theme Preview** panel appears and displays how your changes will look, when the theme is used in an app, based on the field types you modified in the **Theme** panel. This panel is broken up into sub panels.

6. Modify the fields in the **Theme** panel and see a preview of the changes in the **Theme Preview** panel. See Theme and Theme Preview Panel Fields in the Style Guide for Trimble Unity Maintain and Trimble Unity Permit for more information on what fields in the **Theme** panel correspond with the preview view.

7. Once you have finished making changes, click **Save**.

The theme is created and saved.
