

Customize a Plugin

Plugins are customizable at a user level. This means that each layout associated with the plugin has controls that can be customized one way for one user and another way for a different user.

1. In the **Profile** panel, select the plugin from the **Plugin** drop-down list.

The version of the plugin installed in your site displays in the **Plugin Version** field.

2. Select the profile you want to make edits for in the **Profile** drop-down list. If you want a different profile than the default, you can create a profile.

★ **BEST PRACTICE:** It is best to not customize the **default** profile in case you need to revert back to the original plugin layouts when it was first installed.

3. Select the page you want to make edits for from the **Layout** drop-down list.

The **Layout** drop-down list varies depending on the plugin you are customizing.

EXAMPLE

If Respond has been selected as the **Plugin**, then the **Work Order Edit** page is available to select from the **Layout** drop-down list. However, if Storeroom is selected, you'll notice the **Work Order Edit** page is not available to select from the **Layout** drop-down list.

NOTE: If you have customized another layout in a different profile, you can import the layout to another profile. See [Import a Layout](#) in the Style Guide for Trimble Unity Maintain and Trimble Unity Permit for more information.
