**Trimble Unity™**

Enable and Disable Layout ID Mode

You can enable or disable layout ID mode in your browser to view the control and panel IDs in a desired app.

1. While logged in to an app that Style is compatible with (e.g., Respond), navigate to the desired page.
2. To enable layout ID mode, add **?layout-id-mode** at the end of the URL and press **Enter** on your keyboard.

Now the layout of the page (e.g., controls, label text, etc.) appears.

> **NOTE**: Some pages, such as the **Case Summary** page, have more than one layout applied to it. This means that when you view it in layout ID mode, you see multiple layouts in different colors.

3. To disable layout ID mode, remove **?layout-id-mode** at the end of the URL and press **Enter** on your keyboard.

The layout of the page (e.g., controls, label text, etc.) disappear.

> **NOTE**: If you have navigated away from the original page where you added **?layout-id-mode** to the end of the URL, add **?layout-id-mode** to the end of the URL again, refresh the page, and then remove **?layout-id-mode** to disable layout mode.
